

# Superior Features for Today's Production Environments

- Locking mechanism as secure at 5 million cycles as first cycle
- Positive retract
- Improved size to payload ratio
- Minimal maintenance
- Couple/uncouple sensing
- Direct bolt to ISO 9409-1 patterns
- Drop prevention locking feature
- Lifetime warranty on coupling mechanism parts

## Epsilon™ Utility Modules

A host of support items compliment our automatic tool changers. From electricity and pneumatics to coolant and data communications, we offer everything needed to automatically connect seamlessly. Epsilon has what you need to control these connections, all packaged in attractive utility modules that mount neatly to the side bosses of the tool changers.

- 1 Safety Control Module**  
Performance Level D Safety Solution, when paired with an approved switch meets all requirements of EN ISO 13849-1 standard, *Safety of machinery- safety-related parts of control systems*
- 2 High current Support (HIKVA)**  
These modules are specifically designed for the high current transfer required in welding applications
- 3 Servo Module** – Provides motor power and encoder/resolver signals to the end of arm tooling
- 4 I/O & Buss Communications**  
Pass communication and control signals through the tool changer to the end of arm tooling. All connections are heavy duty, industrial grade with dependable self cleaning spring pin connections.
- 5 Pneumatic and Fluid fittings**  
Pass air, water and coolant from the robot through the tool changer to the end of arm tooling. All valves are self sealing to prevent leakage when in the uncoupled state.

## Specialty Models

**ONE THING HOLDS TRUE** in robotic automation...work spaces keep getting tighter and loads keep getting heavier. Here are some highlights of three models that address this trend.

**E125LP** — A low profile design for stamping and other limited space applications. Most tool changers with capacity reaching 225kg (440lbs) are too large to fit between press jaws. No longer. The Epsilon 125 Low Profile is ready to flex its muscles and get to work in your metal fab!

**E125** — The Epsilon 125 is easy to spot because of its rectangular profile. Although not as slim as the 125LP, the shape of the E125's addresses an ever increasing market need. Not only is a fully loaded E125 capable of lifting over 350kg (770lbs) the unique profile allows it to fit through an automobile window facilitating in cabin welding. Another advantage to this package is the ability to tuck neatly into the end of arm shroud now being delivered on some popular robots.

**E160S** — The standard E160 package is similar to the legacy Applied Robotics Sigma 3, the undisputed "go to" work horse of automatic tool changers for years. The E160 footprint and 525kg (1155lb) capacity have been extremely popular, but again following the trend; requests have come in for the same package size with a slightly higher capacity. Hence the E160S which retains the E160 footprint, but upgrades to a steel sender that jumps capacity to a stout 800kg (1760lbs).

## Accessories

**Tool Stands** — Applied Robotics tool stands feature a compact, universal design with the high moment capacity required to safely and securely hold most tooling when not in use. Spring loaded compliancy and tool presence sensing are available as well as specialized heavy-payload versions.

**Cover Assemblies** — Even the cleanest production areas are still subject to airborne debris. Extend the life of your investment by always using a cover assembly with your tool changer. Outfitted with an adjustable power clamp, the cover will automatically open and close allowing easy access for the robot when picking up or dropping off a tool.

# Epsilon™ Automatic Tool Changers

**A breakthrough in the evolution of tool changers**

[www.appliedrobotics.com](http://www.appliedrobotics.com)

# Epsilon™ — the best engineered tool changers are now even better

**AUTOMATIC TOOL CHANGERS RESIDE BETWEEN A ROBOTIC ARM AND ITS TOOLING** allowing the robot to change tools and support utilities on the fly, with no work stoppage. A tool changer is productivity.

The new Epsilon™ incorporates advantages of three previous generations of Applied Robotics, Inc. tool changers with enhancements for today's faster and stronger robots.

- **Higher strength materials** improves size to payload ratio
- **Minimal required maintenance** provides low cost of ownership
- **Direct bolt to ISO 9409-1 patterns** limit the need for robot adaptor plates
- **Couple/uncouple sensing** available on all models
- **Optional tool present sensing**
- **Compatible with existing utility modules** from Applied Robotics
- **Many units share spare parts** for reduced stock requirements
- **Best-in-class locking mechanism** with self-centering cams
- **Mechanical locking feature** ensures robot and tool remain connected under loss of power or air pressure

## Applied Robotics cam lock vs. competitors' ball and collet

**The Engineered Cam:** The Applied Robotics cam lock design has stood the test of time and is known to provide superior reliability and performance. An engineered part, not just an off the shelf ball bearing, Our purpose built cam lock will outperform ball and collet configurations in every way. Reduced maintenance requirements and longevity of service ensure a lifetime cost of ownership far lower than any other design. In fact, the Applied Robotics cam lock is so robust and reliable, it has a life time guarantee. Here's why.

**Wear:** Over time, the Epsilon cam's progressive profile continuously compensates for wear, maintaining a rigid connection. At 5 million cycles the cam design locks as securely as it did on cycle one. Conversely, ball bearings in ball and collet designs wear out with use and become smaller, degrading the connection and potentially introducing a gap and/or play between the robot and tool.

Figure 1: The Applied Robotics engineered cam locks as securely at 5 million cycles as cycle one.

Figure 2: Epsilon E125 and up provide 42mm of linear engagement—it would take 84 balls to match the contact area.

**Retract & Release:** Epsilon cams are controlled by a double-acting piston and drive mechanism. This double acting cylinder arranged with the Applied Robotics cam design enables a “positive retract.” Air pressure is applied to one chamber forcing the cams out and into the coupled position while a second chamber is pressurized to move the piston in the opposite direction pulling the cams back in and releasing the connection. This level of control and confidence is not provided by the ball and collet method, which does not allow for “positive retract.” A ball and collet design relies on gravity to allow the balls to release the collet. When introduced to dirt and debris

### Disadvantages of Ball and Collet

- Inherently very heavy
- Point to point contact is inherently weaker
- Tool and tool changer will gap with wear
- Rotational stability in axis direction only given by guiding pins

that exist in a factory, it's possible for the balls to jam in the locked position, potentially pulling a tool unintentionally out of the stand.

**Rotational Repeatability:** In addition to providing a positive lock/unlock between the robot and tool, it is of the utmost importance the two sides of a tool changer remain precisely aligned. If the mechanism has “slop” in it, the repetitive task the robot is performing will lose its repeatability. This is another area where the cam clearly

Figure 3: Floating driver (1) ensures full contact every time it couples & mechanical lock (2) on the larger models (E80 to ES200) prevents tool separation during a loss of power or air pressure

and consistently outperforms a ball and collet arrangement. As seen in Figure 2, the cam provides a line contact that will resist rotation. In this scenario the guide pins in the master (robot side) of a cam unit are only responsible for guiding the two halves together, not for preventing rotation of the assembly. The rotational stress is largely absorbed by the cams and associated dowel, not by the guide pins. Conversely, a ball and collet design is essentially a bearing race. In order to keep the assembly from rotating, the guide pins are forced to shoulder the rotational inertia building up in the assembly as the robot moves. Rotational stresses wear the guide pins prematurely and begin to introduce play between the joined halves of a ball and collet tool changer, destroying repeatability. In time, the pins must be replaced which leads to downtime and expense. In the worst case scenario, the pins could shear off allowing the entire assembly, tooling and materials to freewheel, damaging products, equipment and potentially causing an injury. This simply does not happen with the positive locking cam system found in the Epsilon.

*Our engineering advantages are your productivity advantages.*
